join means

Answer

Join means combining rows from two or more tables based on a related column between them. In the context provided, there are several examples of joins, including INNER JOIN, LEFT JOIN, and self-join, which are used to combine rows from different tables or the same table based on certain conditions. The purpose of a join is to allow you to retrieve data from multiple tables in a single query, making it easier to analyze and work with the data.

For example, in the query "SELECT e1.name AS Employee1, e2.name AS Employee2, e1.department_id FROM employees e1 JOIN employees e2 ON e1.department_id = e2.department_id AND e1.id < e2.id;", a self-join is used to find pairs of employees in the same department.

In another example, "INNER JOIN reporting r ON e.manager_id = r.id", an inner join is used to combine rows from the "employees" table and the "reporting" table based on the manager_id.

Joins are a fundamental concept in SQL and are used to retrieve data from multiple tables in a single query.
